

Force volumique $\vec{f} = \frac{\chi_m}{2\mu_0} \text{grad } B^2$

$$E_n = -\frac{\chi_{nm}}{2\mu_0} B^2$$

DIAMAGNÉTIQUE
($\chi_m < 0$)

PARAMAGNÉTIQUE
($\chi_m > 0$)

I. Mesure de la susceptibilité magnétique d'un milieu paramagnétique $FeCl_3$ solide Données

$$B = C$$

$$B \neq C$$

Donnús

Donnés
 $\rho_{\text{FeCl}_2} = 2800 \text{ kg.m}^{-3}$

$$\pi = 30\% \text{ (300 g pour 1 L)}$$

$$\mu_0 = 4\pi \times 10^{-7} \text{ SI}$$

Meaus

$$\gamma_{\text{mes}} = \frac{D}{h} = 6,5 \pm 0,3$$

$$\Delta = \pm \text{ cm}$$

$$B = \begin{pmatrix} + \\ - \end{pmatrix} T$$

$$X_{\text{FeCl}_3 \text{ residue}} = \frac{X_{\text{solution}} (\text{FeCl}_3)}{\pi \rho_{\text{residue solution}}} = \frac{49 \text{ mol FeCl}_3 \text{ D}}{8 \text{ B}^2 \pi}$$

$$\chi_{\text{FeCl}_3, \text{solid}} = 4,2 \pm 0,4 \times 10^{-3} \quad \chi_{\text{FeCl}_3, \text{tot}} = 3,3 \times 10^{-3}$$

II. Transition ferromagnétique-paramagnétique déterminée par la température de Curie du fer

$$T_c = \text{---} \pm \text{---}^{\circ}\text{C}$$

$$T_{\text{C kaloris}}^{\text{fer}} = 770^{\circ}\text{C}$$

$$B \approx \frac{\mu_0 N i}{\frac{l}{\mu_r S} + e}$$

$$B \approx \frac{\mu_0 N I}{e}$$

$l \equiv \text{contour}$
"electroaiment"

Dennis

$$\mu_0 = 4\pi \times 10^{-7} \text{ SI}$$

Measures

$$\alpha = 1A \quad \beta = \quad T$$

$$N_{th} = 5600 \text{ quires}$$
