

• Milieux anisotropes - Biréfringence

Champ Electromagnetique $\rightarrow \vec{E}(\vec{r}, t) = \vec{E}_0 e^{i(\vec{k} \cdot \vec{r} - \omega t)}$
 onde plane $\in \mathbb{C}^3$ vecteur d'onde pulsation

$$\vec{E} = k \vec{u}_z$$

$$\vec{E}_0 = E_{0x} e^{i\varphi_x} \vec{u}_x + E_{0y} e^{i\varphi_y} \vec{u}_y$$

$$\vec{u} = \frac{\vec{E}_0}{E_0} = A_x e^{i\varphi_x} \vec{u}_x + A_y e^{i\varphi_y} \vec{u}_y$$

à une phase prise

$$\vec{u} = A_x \vec{u}_x + A_y e^{i\Delta\varphi} \vec{u}_y$$

$$\Delta\varphi = \varphi_y - \varphi_x \quad \text{et} \quad \Delta\varphi(t) \quad \text{fonction du temps}$$

Soit τ le temps de variation typique de $\Delta\varphi$

- Si $\tau \gg T_{\text{détecteur}}$, alors la phase relative entre les deux polarisations $\vec{u}_x$ et $\vec{u}_y$ est bien définie; l'onde est polarisée;
- Si $\tau \ll T_{\text{détecteur}}$, la polarisation fluctue beaucoup plus vite que le temps de réponse du détecteur. Il n'y a aucune corrélation entre φ_x et φ_y , $\Delta\varphi$ est aléatoire. L'onde est dite non-polarisée

$$\begin{cases} \vec{E}_x(t) = E_0 A_x \cos(kz - \omega t) \\ \vec{E}_y(t) = E_0 A_y \cos(kz - \omega t + \Delta\varphi) \end{cases}$$

$$\vec{E}_y(t) = E_0 A_y \cos(kz - \omega t + \Delta\varphi) \quad A_y \vec{E}_y$$

$$\begin{cases} \bar{E}_x(t) = \bar{E}_0 A_x \cos(kz - \omega t) \\ \bar{E}_y(t) = \bar{E}_0 A_y \cos(kz - \omega t + \Delta\varphi) \end{cases}$$

• Polarisation rectiligne $\vec{u} = \begin{pmatrix} \cos\theta \\ \sin\theta \end{pmatrix}$

Parquoi?

$$(\bar{E}_x(\pi/\omega), \bar{E}_y(\pi/\omega)) = (-\bar{E}_x(0), -\bar{E}_y(0))$$

donc symétrique par rapport au centre

ici $\begin{cases} \bar{E}_x(t) = \bar{E}_0 \cos(\theta) \cos(kz - \omega t) \\ \bar{E}_y(t) = \bar{E}_0 \sin(\theta) \cos(kz - \omega t) \end{cases}$

car $\Delta\varphi = 0$ car $\vec{u} \in \mathbb{R}^3$

Donc ici $\begin{cases} \bar{E}_x = \bar{E}_0 \cos(\theta) \times s \\ \bar{E}_y = \bar{E}_0 \sin(\theta) \times s \end{cases}$

équation paramétrique de droite

• Polarisation circulaire $\vec{u} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ \pm i \end{pmatrix}$

ici $A_x = \frac{1}{\sqrt{2}}$ et $A_y = \frac{1}{\sqrt{2}} e^{i\pm\frac{\pi}{2}}$ donc $\Delta\varphi = \pm\frac{\pi}{2}$

donc $\begin{cases} \bar{E}_x(t) = \bar{E}_0 \frac{1}{\sqrt{2}} \cos(kz - \omega t) \\ \bar{E}_y(t) = \bar{E}_0 \frac{1}{\sqrt{2}} (\pm \sin(kz - \omega t)) \end{cases}$

$\cos(\theta \pm \frac{\pi}{2}) = \pm \sin(\theta)$

équation paramétrique d'un cercle

donc

• Polarisation elliptique $\vec{u} = \begin{pmatrix} \cos \theta \\ e^{i\Delta\varphi} \sin \theta \end{pmatrix}$

$$\text{Ici} \quad \begin{cases} \bar{E}_x(t) = \bar{E}_0 \cos \theta \cos(ky - \omega t) \\ \bar{E}_y(t) = \bar{E}_0 \sin \theta \cos(ky - \omega t + \Delta\varphi) \end{cases}$$

1.2. Du groupe $SO(3)$ au groupe $SU(2)$

Autre paramétrisation des rotations.

À la rotation $R_{\vec{n}}(\Psi)$ est associée une unitaire à 4 dimensions

$$u = \left(u_0 = \cos \frac{\Psi}{2}, \vec{u} = \vec{n} \sin \frac{\Psi}{2} \right) \quad u^2 = u_0^2, \vec{u}^2 = 1$$
